

NETWORK SYSTEMS SECURITY SYSTEM

DESCRIPTION:

A network security system is the backbone of a safe and reliable network. It encompasses firewalls, virus and intrusion detection, data recovery, and secure remote access. Our staff of certified engineers and technicians, design, install and support every element of a network system. What's more, we make sure your system has the capacity to grow with your business.

Firewalls are installed to prevent unwanted traffic from passing in and out of the network, as well as provide an additional layer of insurance to secure the network.

Virus and intrusion detection can prevent damage from occurring. It can also repair damage. This preventative measure keeps networks running smoothly and employees productive. Early detection also saves on costs resulting from downtime, including loss of productivity and repairs.

Data backup systems are integral to reliable data recovery. NIC installs systems that provide rapid data restoration. We make sure systems are adequately sized for storage and are fast enough for your business to minimize losses.

Secure remote access increases employee productivity by allowing individuals to obtain information while off property.

Data integrity is most effective when it is an integral part of your daily practice. NIC will help you establish internal "security practices." We will review and recommend policies to maintain a reliable, efficient network. These practices are designed as part of your technology plan and are vital to preventing non-authorized users from accessing information.

Call NIC for a total solution. We are a single source for all of your technology requirements. Services include consulting, design, project management, system installation, maintenance, and support for all network systems.

SERVICES:

Security Assessment and Design Services

- Security auditing by certified engineers*
- Restoration planning for internal and external threats*
- Phased security implementations*
- Wireless security assessment and planning*
- Security policy and practice development*

Network Firewalls

- Protect your resources against unwanted access*
- Strengthen performance by filtering excess traffic*
- Increase network availability by avoiding data attacks*

Virus Prevention and Intrusion Detection

- Protect yourself from service stopping attacks*
- Increase productivity by protecting employees*
- Have peace of mind knowing daily updates are occurring*

Reliable Data Backup Systems

- Hybrid designs for quick data recovery*
- Right sized data-backup systems*
- Scalable solutions accommodate growth*

Secure Remote Access

- Secure access for remote users*
- VPN access between offices*

Support Services

- Emergency restoration services*
- Training for administrators and managers*
- Access to emergency technical assistance*
- Ongoing security auditing*
- Proactive maintenance program*
- Provide spare parts and technical support*
